

Metamorphic Rock-Forming Minerals

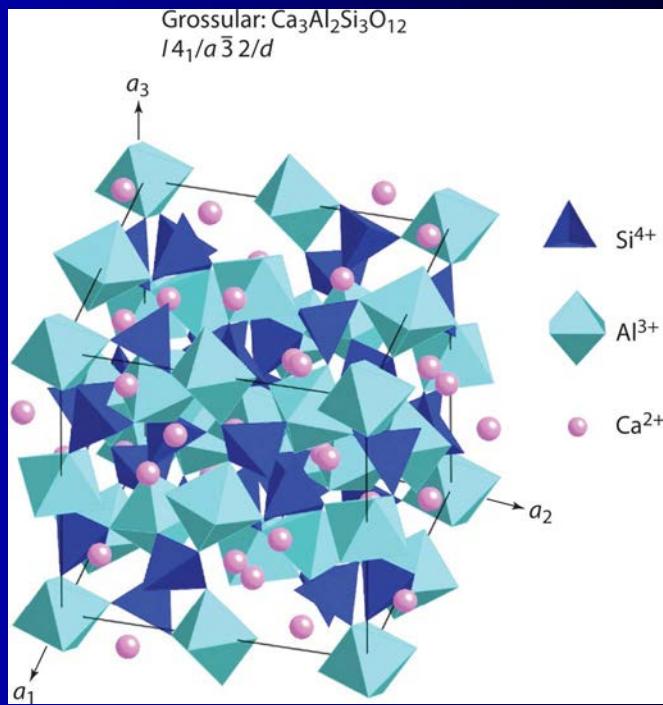

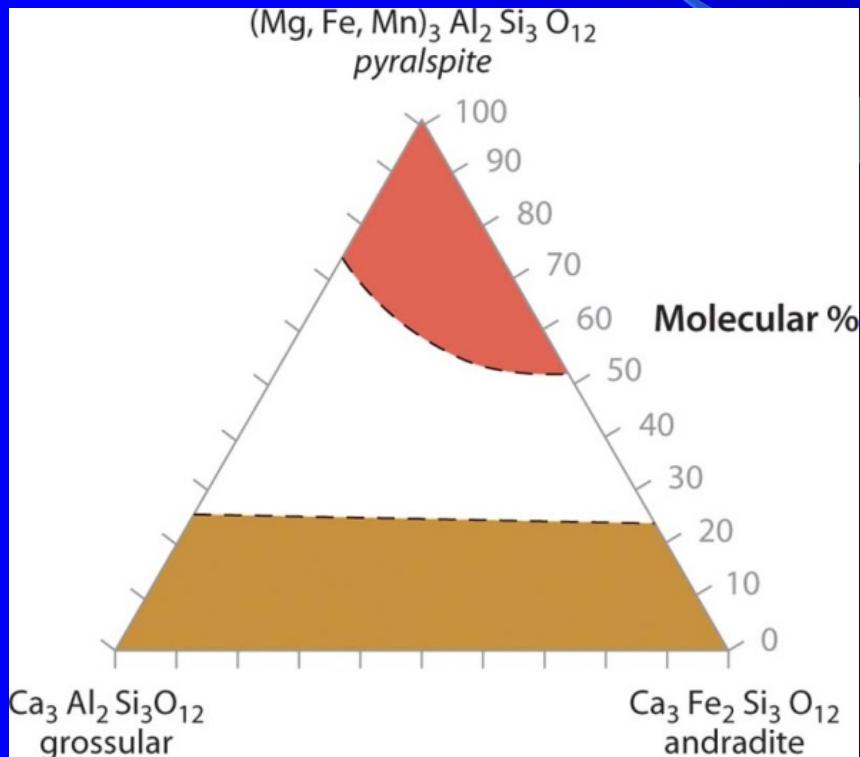

Garnet – pyralspite group

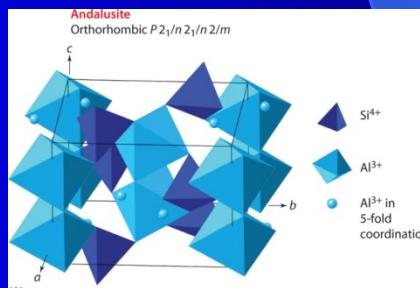

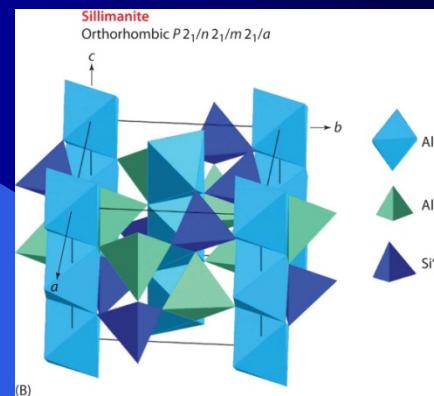

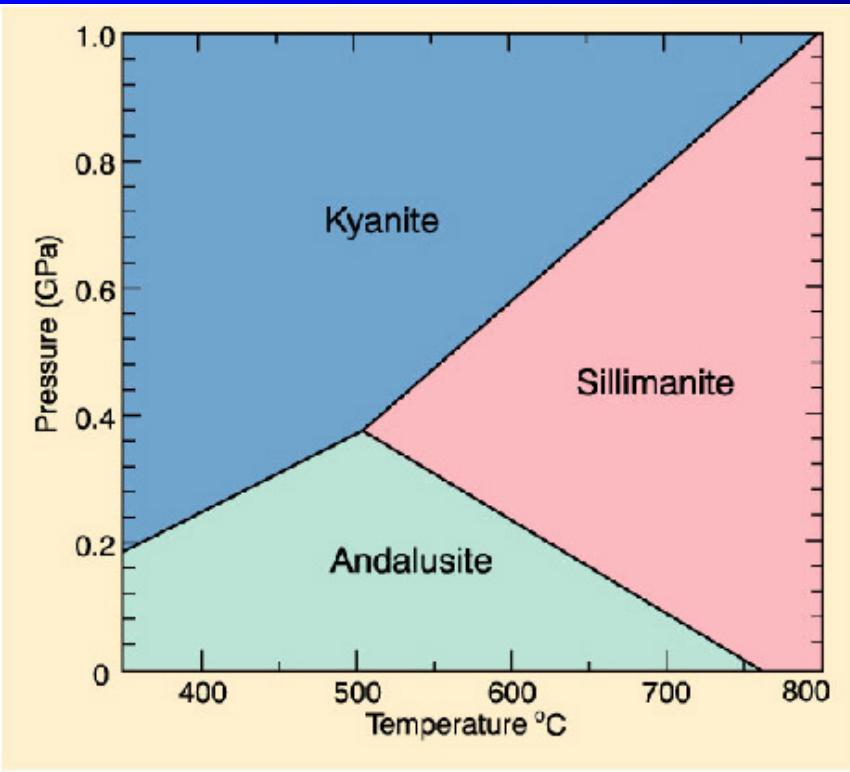

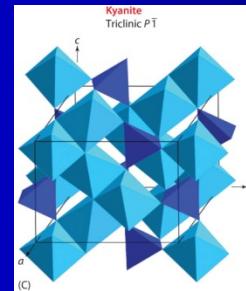

- Pyrope – $\text{Mg}_3\text{Al}_2\text{Si}_3\text{O}_{12}$
- Almandine – $\text{Fe}_3\text{Al}_2\text{Si}_3\text{O}_{12}$
- Spessartine – $\text{Mn}_3\text{Al}_2\text{Si}_3\text{O}_{12}$

Garnet – ugrandite group

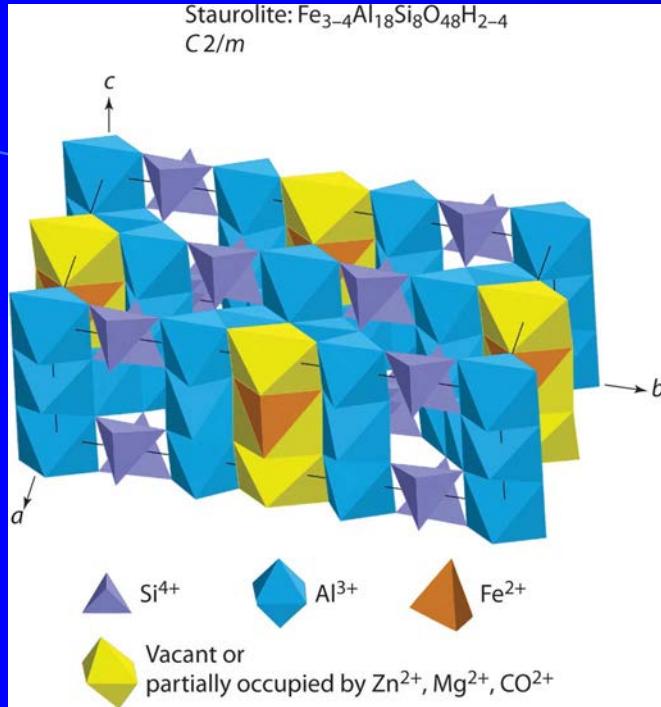

- Grossular – $\text{Ca}_3\text{Al}_2\text{Si}_3\text{O}_{12}$
- Andradite – $\text{Ca}_3\text{Fe}_2\text{Si}_3\text{O}_{12}$
- Uvarovite – $\text{Ca}_3\text{Cr}_2\text{Si}_3\text{O}_{12}$

Al_2SiO_5 Polymorphs

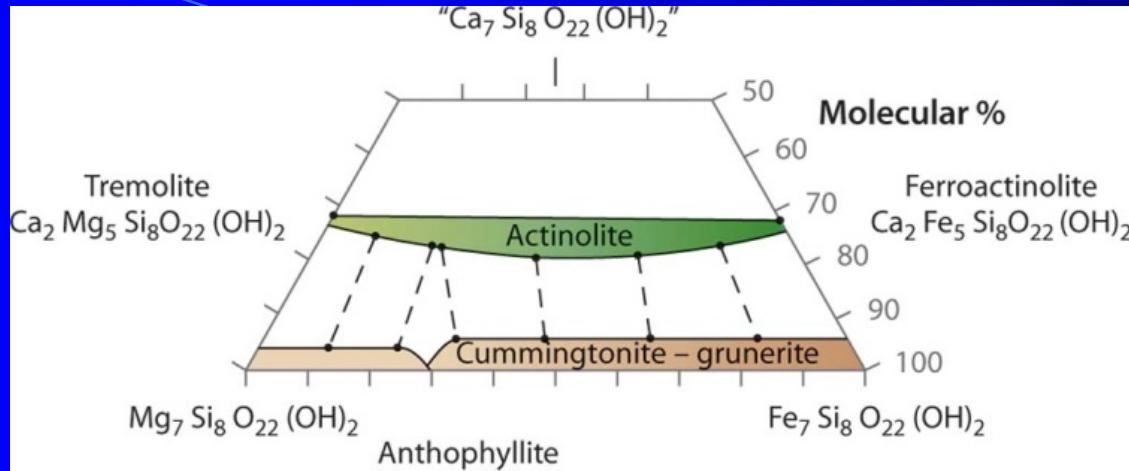

Staurolite ($\text{Fe}_{3-4}\text{Al}_{18}\text{Si}_8\text{O}_{48}\text{H}_{2-4}$)

Pyroxene – Diopside ($\text{CaMgSi}_2\text{O}_6$)

Amphiboles

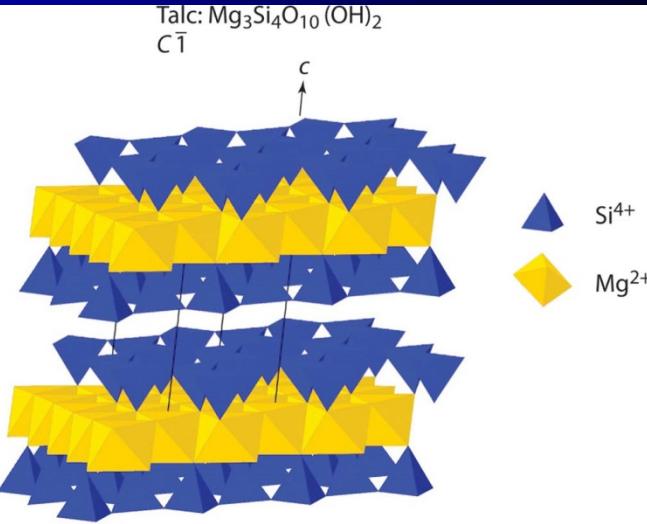

Glaucophane – high pressure low temperature mineral typical of Blueschist facies rocks.

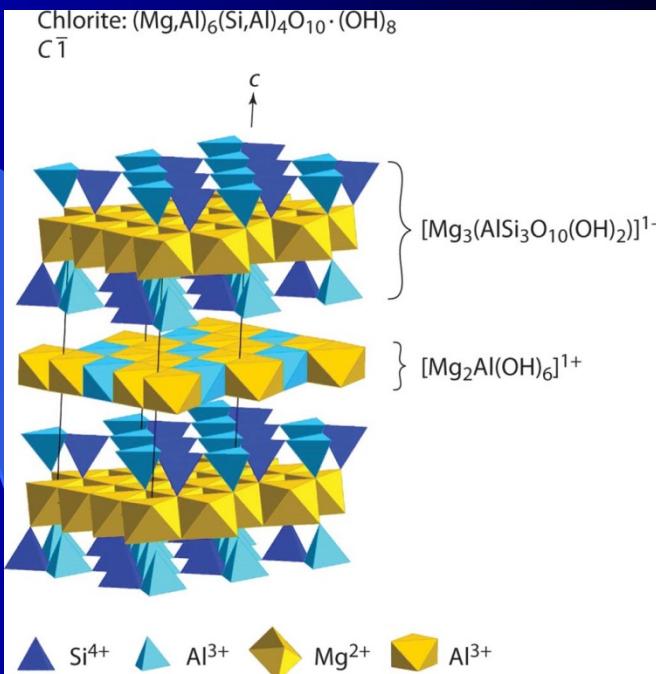

Wollastonite – found in contact metamorphic zones associated with impure limestones.

Talc – forms in Mg-rich rocks through the alteration of magnesium silicates

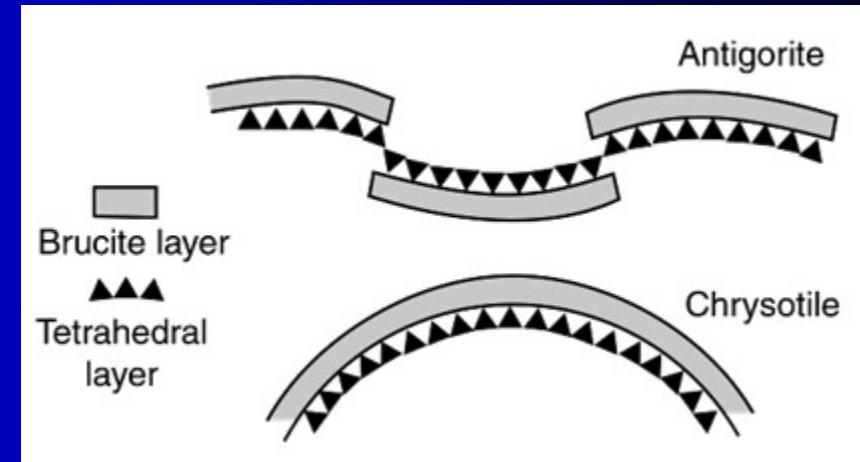

Chlorite – common mineral in greenschist facies rocks.

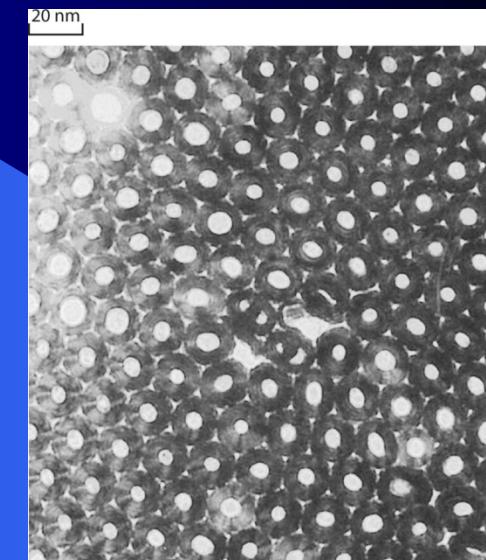

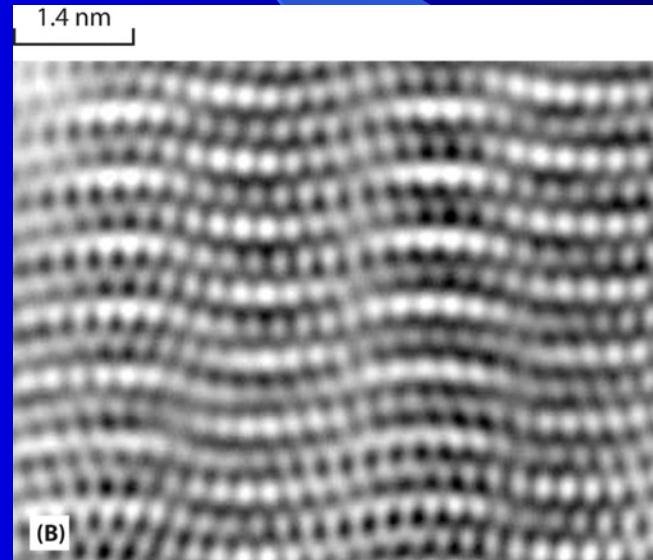

Serpentine minerals – antigorite, chrysotile, and lizardite

All are polymorphs of $Mg_3Si_2O_5(OH)_2$

Antigorite

Chrysotile

Epidote

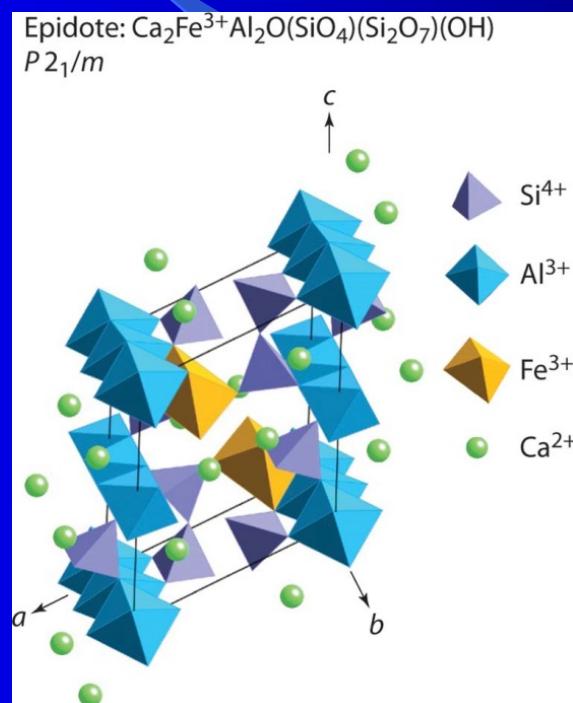

Clinozoisite

Fe³⁺ - Al substitution

Sorosilicate

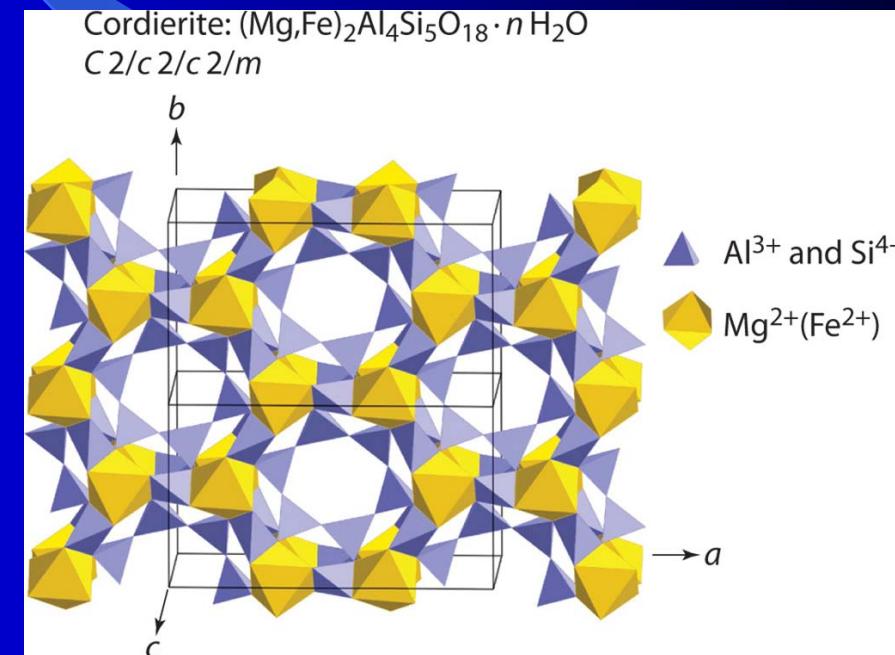

Tanzanite

Cordierite

Cyclosilicate

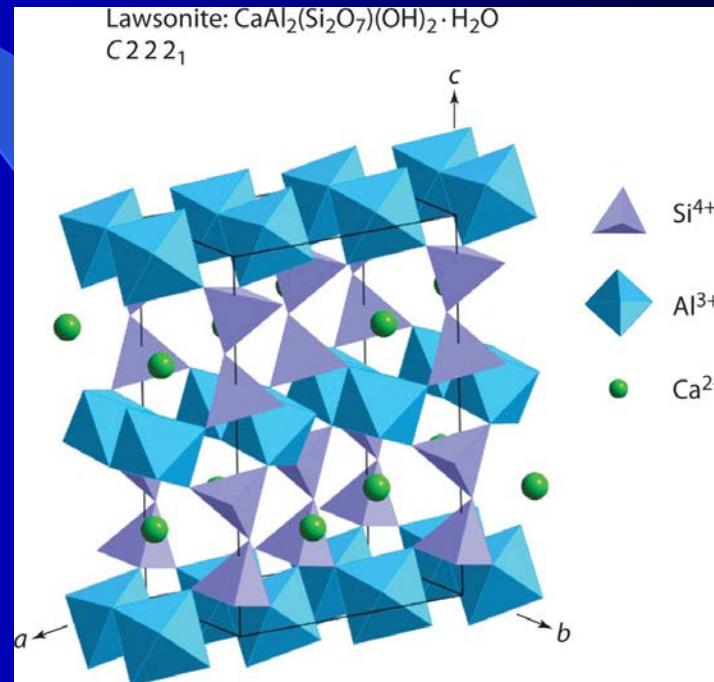

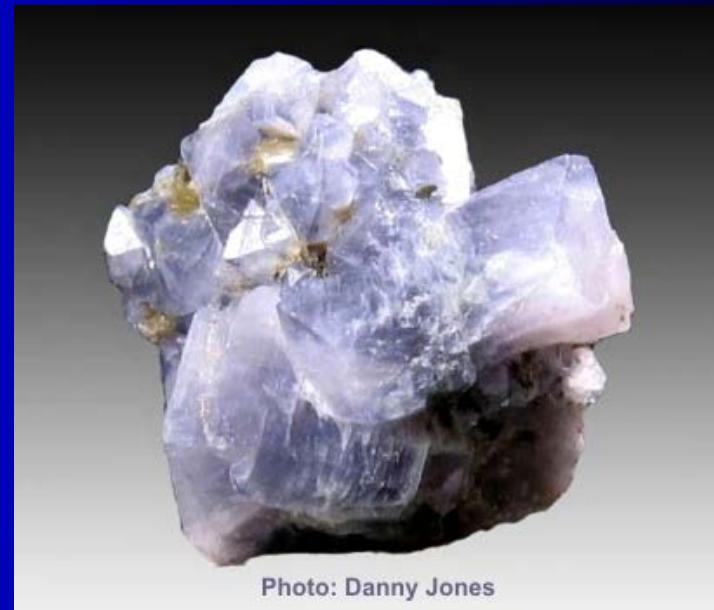

Formed at low pressures and high T. Often found in contact metamorphic rocks.

Lawsonite

Orthorhombic

Common mineral in high-pressure low-temperature metamorphosed basalts. Typical of blueschist facies.

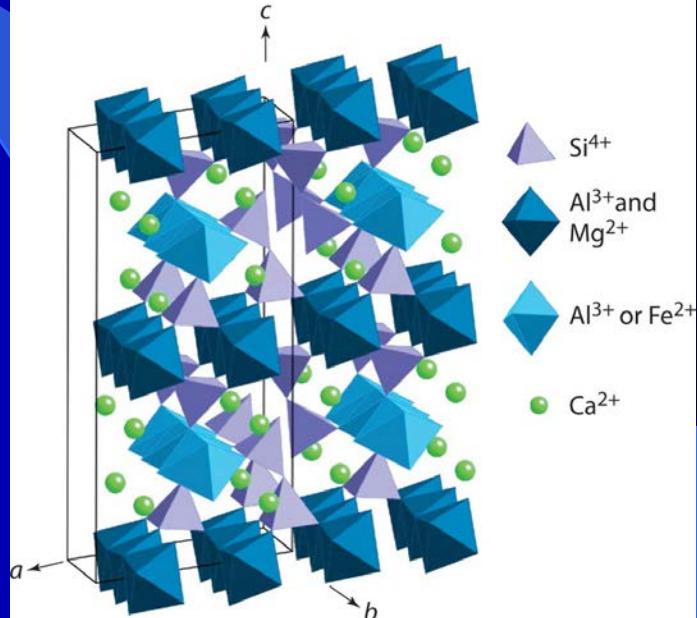

Pumpellyite

Monoclinic

Common constituent of glaucophane schists and as a result of low-grade metamorphism of amygdaloidal basalts.

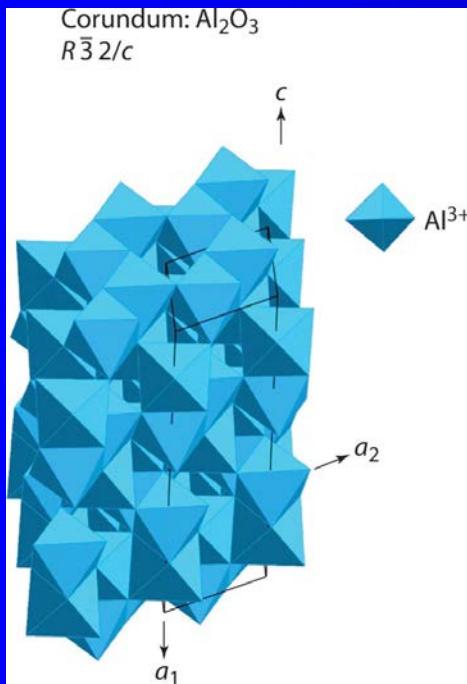

Pumpellyite: $\text{Ca}_2\text{MgAl}_2(\text{SiO}_4)(\text{Si}_2\text{O}_7)(\text{OH})_2 \cdot \text{H}_2\text{O}$
 $A\ 2/m$

Corundum

Extremely high-grade contact metamorphism of aluminous (pelitic) rocks.

Chabazite

Result of low temperature hydrothermal alteration and/or metamorphism in the zeolite facies.

Other zeolite minerals – are analcime, clinoptilolite, heulandite, natrolite, phillipsite, and stilbite.
