Solving First Order Equations

1. Write the d.e. in the form $\frac{dy}{dx} = f(x, y)$.
2. Can the right-hand side $f(x, y)$ be factored into a term involving only x times a term involving only y : $\frac{dy}{dx} = g(x)h(y)$? If so, the d.e. is **separable**. Separate variables and integrate:

$$\int \frac{dy}{h(y)} = \int g(x) dx$$

3. Can the right-hand side $f(x, y)$ be written as $(\text{blob}_1) y + \text{blob}_2$, where the blobs involve only x and constants? If so, the d.e. is **linear**. Rewrite the d.e. in the standard form

$$\frac{dy}{dx} + P(x)y = Q(x),$$

multiply both sides of the standard form of the d.e. by the integrating factor $\rho(x) = e^{\int P(x) dx}$, rewrite the d.e. as $\frac{d}{dx} [\rho(x)y] = \rho(x)Q(x)$, then integrate to get

$$\rho(x)y = \int \rho(x)Q(x) dx + c.$$

4. Can the right-hand side $f(x, y)$ be written as a function of y/x ? For example, can $f(x, y)$ be written as the ratio of two polynomials, each of whose terms all have the same degree? If so, the d.e. is **homogeneous**. Let $v = y/x$. Replace y by xv and replace dy/dx by $v + x \frac{dv}{dx}$. The new d.e. is separable. Solve for v , then replace v by y/x .
5. Rewrite the d.e. in the form $M(x, y) + N(x, y) \frac{dy}{dx} = 0$. If $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$, the d.e. is **exact**. Let $f(x, y) = \int M(x, y) dx$, remembering that the “constant” of integration is $g(y)$. Compute $\frac{\partial f}{\partial y}$, set it equal to $N(x, y)$, solve for $g'(y)$, then integrate to find $g(y)$. Plug this expression for $g(y)$ into your formula for $f(x, y)$. The solution of the d.e. is

$$f(x, y) = c.$$
