Water – Amazing Stuff

Chemical Oceanography

Physical Chemistry of Seawater (E&H Chap. 3)

- 💧 Seawater is 96.5 % H₂O
- 💧 Water unique substance & solvent
- 💧 Review structure
- 💧 Discuss selected unusual properties
- 💧 Consequences of water anomalies
- 💧 Phase diagrams

Molecular Structure of H₂O

Zoom in on O and its neighbors

Part of one period

C ⁶	N ⁷	O ⁸	F ⁹
----------------	----------------	----------------	----------------

**Each can form compounds
with hydrogen**

Boiling Point Comparison

Figure 3.2 in Emerson & Hedges

FIGURE 4.1. Boiling points of compounds structurally similar to water.

Look at O and its relatives

	8	O
	16	S
	34	Se
	52	Te

**Outer shell electronic
Configuration is the same**

Group or Family 6A

Boiling Point Comparison

Figure 3.2 in Emerson & Hedges

FIGURE 4.1. Boiling points of compounds structurally similar to water.

Hydrogen Bonding is key to anomalous properties of water

H-Bonding results from polarity

FIGURE 4.3. The water dipole.

FIGURE 4.4. The three-dimensional structure of the water molecule.

Dipole & Quadrapole Diagrams (Millero 2006) p. 125

Water dipole & quadrupole

Oxygen is shown in red, Hydrogen is shown in gray & Electrons are depicted as yellow

Yet another representation

Water Tetrahedron

The two non-bonded pairs of electrons on oxygen form the back two legs of the tetrahedron, but are not shown

Hydrogen bonding
in liquid water is
always present

However, H-bonds are
constantly forming and breaking

It is a dynamic process that can be represented or
modeled in several ways

See Millero (3rd ed) p 128–132 for models

Water Clusters Dynamically Form, Break and Re-form

TABLE 4.1

Comparison of Physical Properties of H₂O, MeOH, and n-Heptane

Property	H ₂ O	MeOH	n-Heptane
MW	18	32	100
Dipole moment (Debye's)	1.84	1.70	>0.2
Dielectric const.	80	24	1.97
Density (g cm ⁻³)	1.0	0.79	0.73
B.P. (°C)	100	65	98.4
M.P. (°C)	0	-98	-97
Specific heat (cal g ⁻¹ deg ⁻¹)	1.0	0.56	0.5
ΔH_{vap} (cal g ⁻¹)	540	263	76
ΔH_{fus} (cal g ⁻¹)	79	22	34
Surface tension (dynes cm ⁻¹)	73	23	25
Viscosity 20°C (poise)	0.01	0.006	0.005
Compressibility 25°C (atm ⁻¹)	4.57×10^{-11}	12.2×10^{-11}	14×10^{-11}

Water Properties

High Heat Capacity (C_p)

(Heat energy to raise 1 g of water 1 °C)

Prevents extreme ranges of temperature (temp buffering)

Allows heat transfer by water masses to be large

Water Properties

High Heat of Fusion

($\Delta H = 79 \text{ cal/g}$)

(Heat energy for melting solid)

Absorption or release of latent heat results in
high thermostatic effect

a.k.a. Enthalpy of Fusion (kJ/kg)

Water Properties

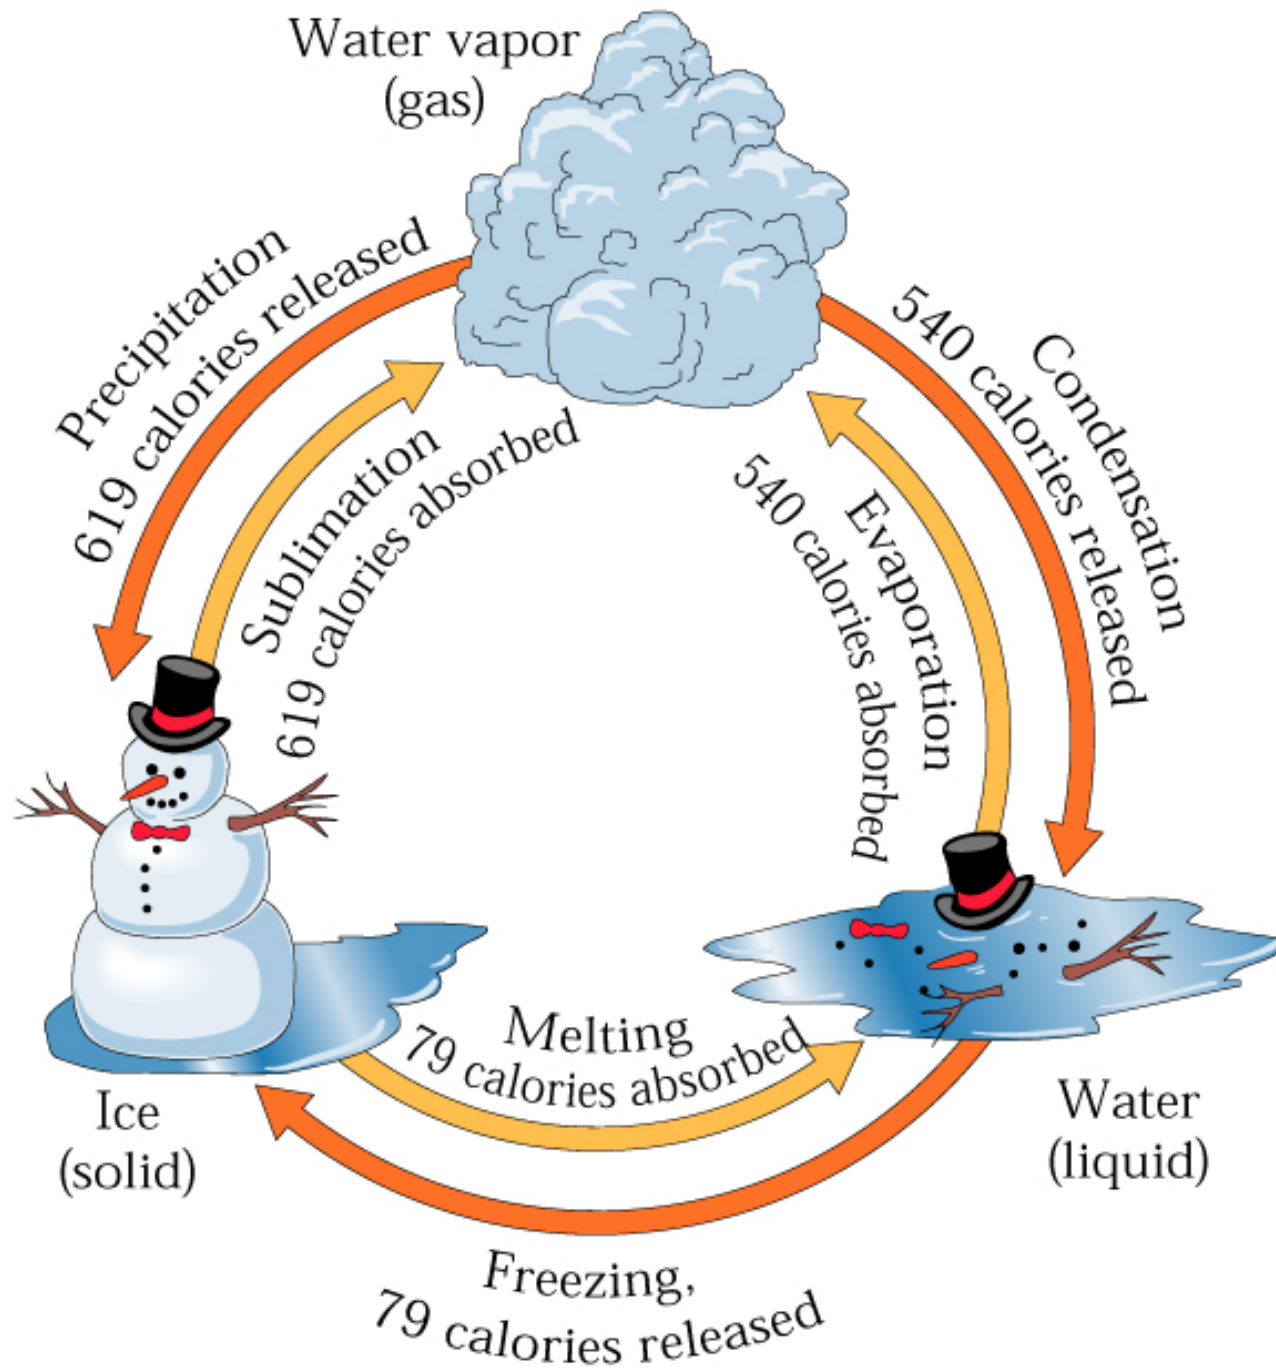

High Heat of Vaporization
($\Delta H = 540 \text{ cal/g}$)

(Heat energy for evaporating liquid)

Highest of all liquids

Results in evaporative cooling and transfer of
heat to atmosphere, thermostating

a.k.a. Enthalpy of Vaporization

Large Quantities of Heat are Absorbed & Released During Phase Changes

Water Properties

Thermal Expansion

(temperature of maximum density)

Waters with low or no salt content have
maximum density above freezing points

Ice floats

Simple Phase Diagram of Water

(Wiley 1999)

Water Properties

High Dielectric Constant

(highest of almost all substances)

Results in charge insulating power

Important in dissolution of salts

Important in hydration of ions

Water Properties

Relatively High Viscosity

(high for low molecular weight substance)

Important in wave and current formation

Water Properties

High Surface Tension

(highest of all substances)

Controls drop formation, important in waves
and many surface properties

Important in cell physiology

Interfacial Tension
creates appearance
of a “skin” on surface
