TABLE 10.2
Photoreactions of Organic Compounds

Chromophore	Products or effects
Humic, fulvic	1. Bleaching of absorption and fluorescence
	2. Production of singlet oxygen
	3. Fe(III) reduction
	4. Release of soluble P
	5. Oxidation of cumene via ROO and OH radicals
	6. Oxidation of phenolic groups to ArO and formation of e^- and O_2^-
	7. CO formation
	8. H_2O_2 formation (via O_2^- ?)
Chlorophyll	Loss of chlorophyll
Vitamins	Loss of bioassay activity
Amino acids	?
Glycine	COOH C-14 loss, HCHO 1 formation
$CH_3SSCH_3CH_3S$	CH_3S
CH_3ICH_3	CH_3
Fatty acids	Particles, absorb., hydroperoxides
Aldehydes	RCO, R, CO

Maturation and Fossilization are terms that refer to the formation of fossil fuels (coal, petroleum) from plant and animal material (biomolecules).

The overall process can be split into two or three major parts:

Marine → Diagenesis, Catagenesis, Metagenesis

Terrestrial → Humification, Coalification

May 1981, Volume 212, Number 4496

Sludge Decomposition and Stabilization

Roy Hartenstein

of sludge decomposition and stabilization can be enhanced, to discuss the highly probable consequences of sludge stabilization in light of the basic information, and to suggest procedures for evaluating the sludge stabilization process. As a starting point, it is necessary to describe the fossilization pathway of the carbon cycle.

The Fossilization Pathway of the Carbon Cycle

Kerogens, coals, and petroleum oils are the earth's major fossil fuels; they

Early diagenesis of organic matter in recent Black Sea sediments: characterization and source assessment

Abstract—The organic matter in 9 recent (not more than 250 years old) and 'organic-rich' sediments from the southern Black Sea shelf and upper slope have been characterized semi-quantitatively by Pyrolysis/Gas Chromatography/Mass Spectrometry (PY/GC/MS) and ^{13}C Cross Polarization Magic Angle Spinning Nuclear Magnetic Resonance (CPMAS-NMR) spectrometry. The organic matter of 7 of the studied sediments was found to be ligno-carbohydrate with a proteinaceous component, one sediment appeared to contain oxidized coal dust and one contained thiophenes in association with pyrite. The ligno component is derived from grasses and soft wood lignin. Material entrapped in an anoxic environment contained the highest proportions of carbohydrate and protein. All the samples had suffered diagenesis as is generally shown by the attachment of carboxyl groups and the removal of methoxyl groups. The evidence suggests that diagenesis occurred whilst the particles traversed the oxic water column.

Sediment Diagenesis includes more than Organic Matter Transformations – Many redox processes occur

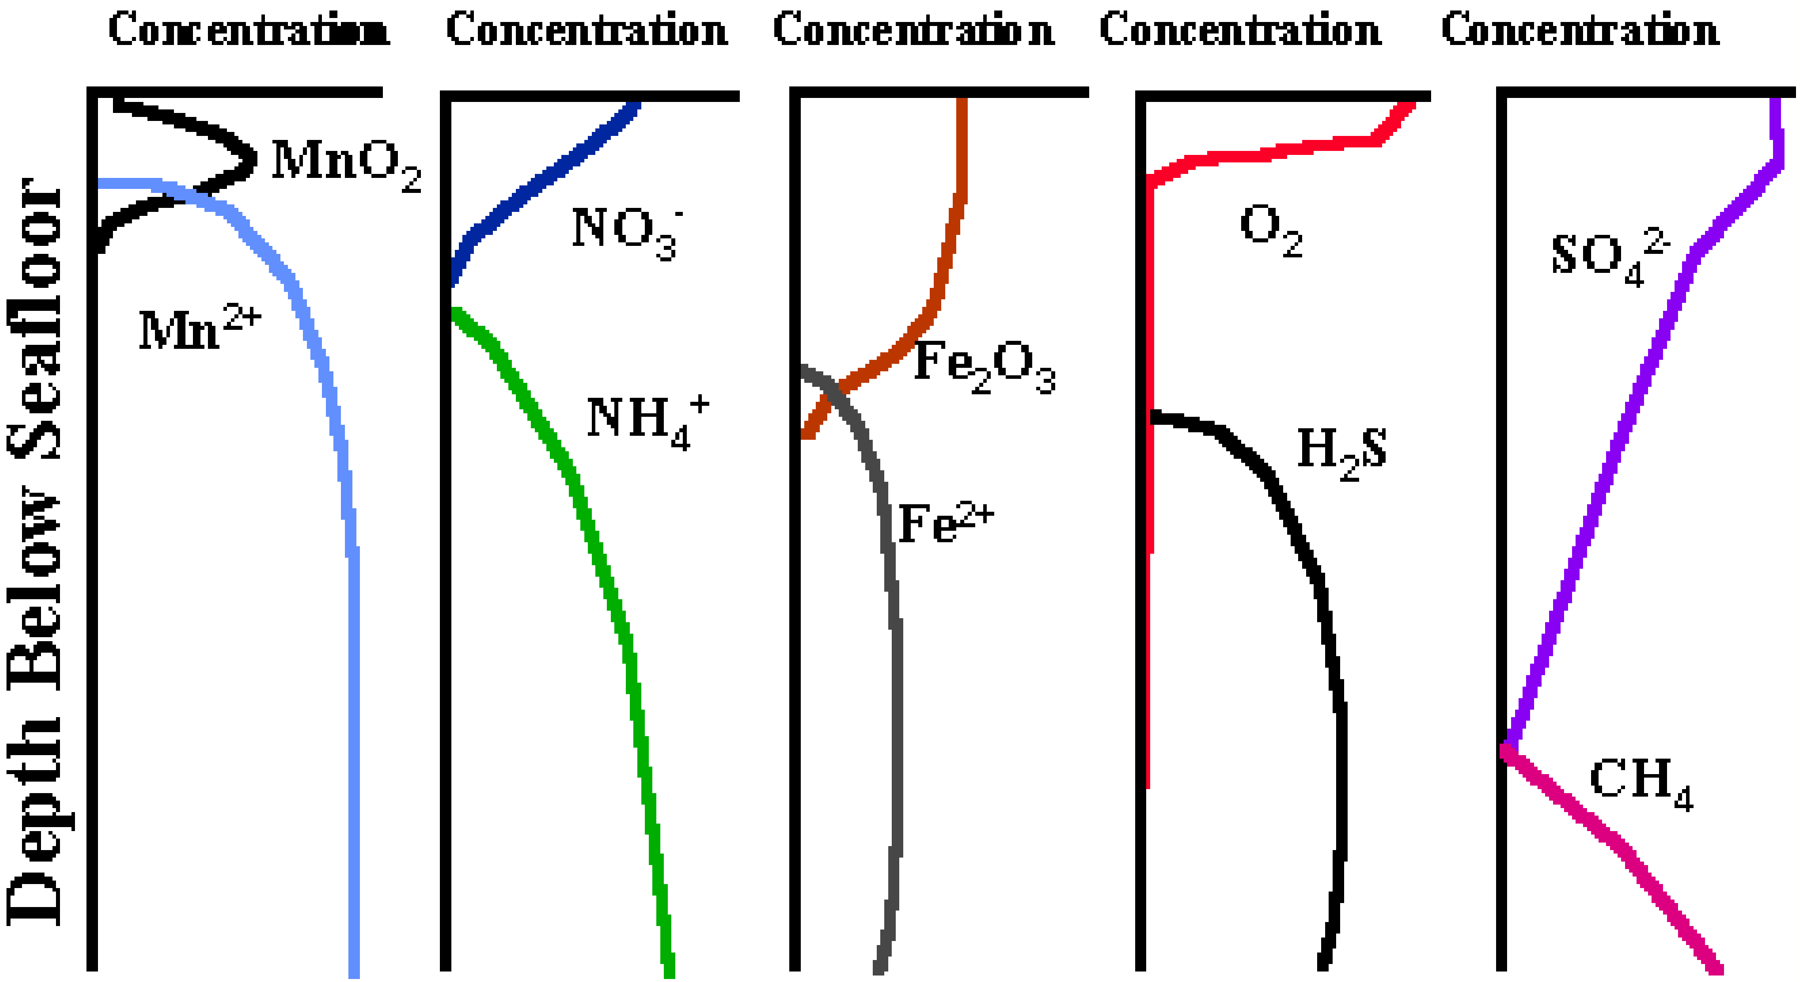

Table 12.2. *Stoichiometry of organic matter oxidation reactions*

Redfield ratios for *x*, *y* and *z* are 106, 16, 1.

Redox process	Reaction
Aerobic respiration	$(CH_2O)_x(NH_3)_y(H_3PO_4)_z + (x+2y)O_2 \rightarrow$ $xCO_2 + (x+y)H_2O + yHNO_3 + zH_3PO_4$
Nitrate reduction	$5(CH_2O)_x(NH_3)_y(H_3PO_4)_z + 4xNO_3^- \rightarrow$ $xCO_2 + 3xH_2O + 4xHCO_3^- + 2xN_2 + 5yNH_3 + 5zH_3PO_4$
Manganese reduction	$(CH_2O)_x(NH_3)_y(H_3PO_4)_z + 2xMnO_2(s) + 3xCO_2 + xH_2O \rightarrow$ $2xMn^{2+} + 4xHCO_3^- + yNH_3 + zH_3PO_4$
Iron reduction	$(CH_2O)_x(NH_3)_y(H_3PO_4)_z + 4xFe(OH)_3(s) + 7xCO_2 \rightarrow$ $4xFe^{2+} + 8xHCO_3^- + 3xH_2O + yNH_3 + zH_3PO_4$
Sulfate reduction	$2(CH_2O)_x(NH_3)_y(H_3PO_4)_z + xSO_4^{2-} \rightarrow$ $xH_2S + 2xHCO_3^- + 2yNH_3 + 2zH_3PO_4$
Methane production	$(CH_2O)_x(NH_3)_y(H_3PO_4)_z \rightarrow$ $xCH_4 + xCO_2 + 2yNH_3 + 2zH_3PO_4$
